

# VE281

## Data Structures and Algorithms

### **Trees**

#### **Learning Objectives:**

- Know some basic terminology of trees and binary trees
- Know some basic properties of binary trees
- Know how to represent a binary tree by an array and a linked list

# Outline

- Trees
- Binary Trees

# Trees

- Tree is an extension of linked list data structure:
  - Each node connects to **multiple** nodes.
- A tree is a “natural” way to represent hierarchical structure and organization.
- Many problems in computer science can be solved by breaking it down into smaller pieces and arranging the pieces in some form of hierarchical structure.
  - For example: merge sort.

# Tree Terminology

- Just like lists, trees are collections of nodes.
- The node at the top of the hierarchy is the **root**.
- Nodes are connected by **edges**.
- Edges define **parent-child** relationship.
  - Root has no parent.
  - All other nodes have exactly one parent.
- A node with no children is called a **leaf**.

# Subtrees

Subtree can be defined for any node in general, not just for the root node.

# More Tree Terminology

- f is the **child** of b.
- b is the **parent** of f.
- Nodes that share the same parent are **siblings**.
  - b and c are the **siblings** of d.
  - e is the **sibling** of f.

# Path

- A **path** is a sequence of nodes such that the next node in the sequence is a child of the previous.
  - E.g.,  $a \rightarrow b \rightarrow e \rightarrow h$  is a path.
  - The path length is 3.
- Path length may be 0, e.g., b going to itself is a path and its length is 0.
- **Claim**: If there exists a path between two nodes, then this path is the **unique** path between these two nodes.

# Ancestors and Descendants

- If there exists a path from a node A to a node B, then A is an **ancestor** of B and B is a **descendant** of A.
- E.g., a is an ancestor of h and h is a descendant of a.

# Depth, Level, and Height of a Node

- The **depth** or **level of a node** is the length of the unique path from the root to the node.
  - E.g.,  $\text{depth}(b)=1$ ,  $\text{depth}(a)=0$ .
- The **height of a node** is the length of the longest path from the node to a leaf.
  - E.g.,  $\text{height}(b)=2$ ,  $\text{height}(a)=3$ .
  - All leaves have height zero.

# Depth, Level, and Height of a Tree

- The **height of a tree** is the height of its root.
  - This is also known as the **depth of a tree**.
  - The depth of the tree on the right is 3.
- The **number of levels of a tree** is the height of the tree **plus one**.
  - The number of levels of the tree on the right is 4.

# Degree

- The **degree of a node** is the number of children of a node.
  - E.g.,  $\text{degree}(a) = 3$ ,  
 $\text{degree}(c) = 1$ .
- The **degree of a tree** is the maximum degree of a node in the tree.
  - The degree of the tree on the right is 3.

# A Simple Implementation of Tree

- Each node is part of a **linked list** of siblings.
- Additionally, each node stores a pointer to its **first child**.

```
struct node {  
    Item item;  
    node *firstChild;  
    node *nextSibling;  
};
```

# Outline

- Trees
- Binary Trees

# Binary Tree

- Every node can only have **at most two** children.
- An empty tree is a special binary tree.

# Binary Tree Properties

- What is the **minimum** number of nodes in a binary tree of height  $h$  (i.e., has  $h + 1$  levels)?
  - Answer: **At least** one node at each level.
  - $h + 1$  levels means at least  $h + 1$  nodes.

- What is the **maximum** number of nodes in a binary tree of height  $h$  (i.e., has  $h + 1$  levels)?
  - Answer: At most  $2^k$  nodes at level  $k$ .
  - Maximum number of nodes is

$$1 + 2 + 2^2 + \dots + 2^h = 2^{h+1} - 1$$

# Number Of Nodes and Height

- **Claim** (from the previous slide): Let  $n$  be the number of nodes in a binary tree whose height is  $h$  (i.e., has  $h + 1$  levels).
  - We have  $h + 1 \leq n \leq 2^{h+1} - 1$ .
- **Question**: given  $n$  nodes, what is the height  $h$  of the tree?
  - $\log_2(n + 1) - 1 \leq h \leq n - 1$

# Types of Binary Trees

- A binary tree is **proper** if every node has 0 or 2 children.
- A binary tree is **complete** if:
  1. every level **except** the lowest is fully populated, and
  2. the lowest level is populated from left to right.
- A binary tree is **perfect** if **every level** is fully populated.

# Which Statements Are Correct?

- A.** Trees  $a$  and  $d$  are proper.    **B.** Tree  $c$  is complete.  
**C.** Trees  $b$  and  $f$  are complete.    **D.** Tree  $e$  is perfect.

# Numbering Nodes In a Perfect Binary Tree

- Numbering nodes from 1 to  $2^{h+1} - 1$ .
- Numbering **from top to bottom** level.
- Within a level, numbering **from left to right**.

# Numbering Nodes In a Perfect Binary Tree

- What is the parent of node  $i$ ?
  - For  $i \neq 1$ , it is  $\lfloor i/2 \rfloor$ . For node 1, it has no parent.
- What is the left child of node  $i$ ? Let  $n$  be the number of nodes.
  - If  $2i \leq n$ , it is  $2i$ ; If  $2i > n$ , no left child.
- What is the right child of node  $i$ ?
  - If  $2i + 1 \leq n$ , it is  $2i + 1$ ; If  $2i + 1 > n$ , no right child.

# Representing Binary Tree Using Array

- Based on the numbering scheme for a **perfect** binary tree.
- If the number of the node **in a perfect binary tree** is  $i$ , then the node is put at index  $i$  of the array.

a	b	c	d	e	—	—	—	—	f	g
[1]	[2]	[3]	[4]	[5]	[6]	[7]	[8]	[9]	[10]	[11]

# How Would You Represent a **Right-skewed** Binary Tree?

- Assume array index starts from 1.

	[1]		[3]		[5]		[7]		[9]		[11]		[13]		[15]
<b>A.</b>	a	b	—	c	—	—	—	d	—	—	—	—	—	—	—

**B.**

a	b	c	d	—	—	—	—	—	—	—	—	—	—	—
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

**C.**

a	—	b	—	—	—	c	—	—	—	—	—	—	—	d
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

D.

a	—	b	—	c	—	d	—	—	—	—	—	—	—	—
[1]		[3]		[5]		[7]		[9]		[11]		[13]		[15]

An  $n$  node binary tree needs an array whose length is between  $n + 1$  and  $2^n$ .

# Representing Binary Tree Using Linked Structure

```
struct node {  
    Item item;  
    node *left;  
    node *right;  
};
```

- **left/right** points to a left/right **subtree**.
  - If the subtree is an empty one, the pointer points to **NULL**.
- For a leaf node, both its **left** and **right** pointers are NULL.
